Resurrecting Insignia SoftWindows95 for SGI IRIX

Well, well, I just feel like 14 years ago, playing around with my rather aged SGI O2, which I didnt touch for years, doing a fresh reinstall of IRIX and some apps.

While flipping through my CDs I stumbled accross SoftWindows95 for IRIX. I just couldn't resist and put the flipper in, having the software installed just minutes later, only to see that I didn't have the license any more :-(

But there's hope ...

After some searching I found a Usenet article with a valid license of SoftWindows95. Well, I think it's fair enough to republish this, as for one, Insignia has sold-off SoftWindows about 10 years ago, and the successor company FWB Software stopped development in 2001, furthermore that company doesn't exist anymore as it has been sold-off, too. Well, not even SGI is able to provide a license key for a software, which is 14 years old ... hm.... Well, I _think_ it's ok, otherwise let me know ...

To activate SoftWindows95 just place this text into /usr/lib/SoftWindows95/FLEXlm/license.dat:

```
FEATURE Insignia_SoftWindows95 insignia 4.000 01-jan-0 0
    ECE41259D5BE4700DC27 VENDOR_STRING="5100 0100 0000 0001"
    HOSTID=ANY vendor_info=SOFTWINDOWS95 ISSUER="Silicon Graphics,
    Inc."
```

The license won't show up from the GUI _but_ SoftWindows95 will work.

Considering the age of the O2 and it's dated 200 MHz MIPS CPU the emulation speed isnt't too bad.
I remembered it being worse than thaz, but maybe that's just the "geekness" of having gotten something very old to work again ;-)
